

Custom Proposal Test Report Auto Creation System

When it is required to attach the experiment data results on the sample before the next process or shipping, creating reports at the end of each experiment takes a huge amount of time.

To answer this problem, the test data (report) can be printed automatically using “Test Report Auto Creation System”.

This system can be connected to multiple chambers using one dedicated PC with the appropriate software installed.

Additionally to the automatic printing function, the following actions (and many more) can be made on all the connected chambers: operation status monitoring, test data storage, test programs setting, operation start / stop, etc.

* Some chambers have exceptions.
